

Bob — AI Hackathon Submission

Team: Bob Builders · Track: Developer Tools & Productivity

Repository: github.com/drijesh-ppatel/bob-ai-hackathon-submission-template

Problem

Developers and hackathon teams lose time wiring boilerplate, CI/CD, and demo scaffolding. Repetitive setup slows iteration and distracts from product logic — especially for small teams under time constraints.

Who is affected?

Hackathon teams, early-stage startups, instructor-led projects.

Why it matters

Wasted time on infrastructure reduces time for product polish, testing and demos.

Solution — Bob Template

A ready-to-clone project template that bundles development scaffolding, example features, CI configuration and deployment scripts so teams can focus on core product work.

Starter app

Minimal functional app with clear entry points for custom logic and UI.

CI / Tests

Preconfigured GitHub Actions for build, test and linting — ready to run.

Deploy scripts

One-command deployment examples (containers, serverless) and README guidance.

Architecture

How it fits together

- Local dev: starter code, example components and hot-reload
- Repo: branch structure, issue templates and contribution guide
- CI: automated builds, unit tests, and artefact publishing
- Deployment: container image or serverless function with example env files

□ Architecture emphasises fast onboarding and reproducible demos.

Demo — Key Feature Walkthrough

Demo highlights a runnable feature from the template: a small end-to-end flow (UI → API → persistence) that can be customised in minutes.

01

1. Clone

git clone the repo and open in your editor.

02

2. Run

npm install && npm run dev — hot reload for rapid iteration.

03

3. Deploy

Use included script to build container and push to cloud provider.

IBM Technologies Used

- IBM Cloud / Code Engine — reference deployment examples and templates
- IBM Watson (optional) — example integration pattern for AI features
- Cloud Databases — sample environment and connection guidance
- DevOps tools — demonstrated CI/CD workflow compatible with IBM services

Each example includes configuration snippets and links to IBM docs so teams can reproduce the environment quickly.

Results, Next Steps & Team

Results

Faster onboarding: template reduces setup time from hours to minutes. Consistent demos: reproducible build & deploy steps for judges and reviewers.

Next steps

- Polish docs and example dataset
- Add more IBM integrations and deployment presets
- Create templates for other stacks (Python, Go)

Team

Contributors (from repo): roles listed in README — include frontend, backend, infra and docs owners. See repo for contact and contribution details.

Deliverables: slides.pdf (place in the project folder), slides.pptx optional. For full code and instructions, visit the repository link above.
